

Replacement analysis using economic life

- Three years ago a chemical processing plant installed a system at a cost of \$ 20,000 to remove pollutants from waste water that is discharged into a nearby river. The present system has **no present salvage value** and will cost **\$14500 to operate next year**, with the operating cost expected to **increase at the rate of \$500 per year** thereafter.
- A new system has been designed **to replace** the existing system **at a cost of \$10000**. The new system is expected to have **first year operating of \$9000** with these costs **increasing at the rate of \$1000 per year**. The new system is estimated to have a useful life of 12years. The salvage values of **both the system at any future time** are expected to **be zero**. If the interest rate is 12% conduct replacement analysis based on the economic life of the asset.

SOLUTION

The equation for finding the total equivalent annual cost (EUAC) for the existing system can be written as,

$$\text{EUAC} = \text{CR}(i) + \text{Equivalent Annual Operating Costs (Eq. AOC)}$$

Since the present system has no salvage value at present or in future, $P=F=0$

$$\text{Therefore, EUAC} = 14500 + 500 (A/G, i, n)$$

For $n=1$,

$$\begin{aligned}\text{EUAC} &= 14500 + 500 (A/G, i, n) \rightarrow \text{EUAC} = 14500 + 500 (A/G, 12, 1) \\ &= 14500/- \$/\text{yr}\end{aligned}$$

For $n=2$,

$$\begin{aligned}\text{EUAC} &= 14500 + 500 (A/G, i, n) \rightarrow \text{EUAC} = 14500 + 500 (A/G, 12, 2) \\ &= 14736/- \$/\text{yr}\end{aligned}$$

For $n=3$,

$$\begin{aligned}\text{EUAC} &= 14500 + 500 (A/G, i, n) \rightarrow \text{EUAC} = 14500 + 500 (A/G, 12, 3) \\ &= 14962/- \text{ \$/yr}\end{aligned}$$

- It can be seen that since the present system has no present and future salvage value its equivalent annual costs consists of only Eq. AOC.
- Hence the EUAC will increasing every year.
- Therefore the economic life of this is ONE year with EUAC = 14500

The equation for finding the total equivalent annual cost (EUAC) for the new system can be written as,

$$\text{EUAC} = \text{CR}(i) + \text{Equivalent Annual Operating Costs (Eq. AOC)}$$

$$\text{Therefore, EUAC} = (P-F) (A/P, i, n) + Fi + 9000 + 1000 (A/G, i, n)$$

$$P = 10,000; F = 0; i = 12\%$$

For $n=1$,

$$\begin{aligned}\text{EUAC} &= 10,000 (A/P, 12, 1) + 9000 + 1000 (A/G, 12, 1) \\ &= 20,200/- \text{ \$/yr}\end{aligned}$$

For $n=2$,

$$\begin{aligned}\text{EUAC} &= 10,000 (A/P, 12, 2) + 9000 + 1000 (A/G, 12, 2) \\ &= 15,389/- \text{ \$/yr}\end{aligned}$$

For n=3,

$$\begin{aligned}\text{EUAC} &= 10,000 (A/P, 12, 3) + 9000 + 1000 (A/G, 12, 3) \\ &= 14,089/- \text{ \$/yr}\end{aligned}$$

For n=4,

$$\begin{aligned}\text{EUAC} &= 10,000 (A/P, 12, 4) + 9000 + 1000 (A/G, 12, 4) \\ &= 13,651/- \text{ \$/yr}\end{aligned}$$

For n=5,

$$\begin{aligned}\text{EUAC} &= 10,000 (A/P, 12, 5) + 9000 + 1000 (A/G, 12, 5) \\ &= 13,549/- \text{ \$/yr}\end{aligned}$$

For n=6,

$$\begin{aligned}\text{EUAC} &= 10,000 (A/P, 12, 6) + 9000 + 1000 (A/G, 12, 6) \\ &= 13,604/- \text{ \$/yr}\end{aligned}$$

For n=7,

$$\begin{aligned}\text{EUAC} &= 10,000 (A/P, 12, 7) + 9000 + 1000 (A/G, 12, 7) \\ &= 13,742/- \text{ \$/yr}\end{aligned}$$

The economic life of the new system is FIVE years with EUAC = 13549

The Results can be tabulated as follows

	Present System	New system
Economic Life	n=1	n= 5
EUAC	14500	13549

***Conclusion: From the economic life and EUAC the existing system
should be replaced by new system***
